

CS-E4960 - Software Testing and Quality Assurance D, Lecture, 3.9.2024-26.11.2024

This course space end date is set to 26.11.2024 [Search Courses: CS-E4960](#)

Team testing

To do: Make a submission

Due: Tuesday, 5 November 2024, 10:00 AM

In this assignment, you will form pairs with members of your group and do testing together as a team.

To complete the assignment, do the following:

1. Form pairs with your group members. If you have an odd number of people in your group, there can be one sub-group of three while the others form pairs.
2. Create a testing plan for the whole group. The testing plan should include a testing charter for each pair that defines some starting point, focus area, and overall goal (or three-person sub-group) to direct their testing. The style of testing is exploratory testing. Make sure that the charter is broad enough to enable deep and detailed exploration by more than one person. Consider using a quality model like ISO/IEC 25010 to think of specific users and their activities that could be the basis for your plan.
3. Each pair or sub-group should carry out pair testing (see below). The outcomes of the testing should be documented.
4. Discuss the documented test results in the group. Write a short summary of all the results. Also evaluate how well the testing worked.
5. Submit the plan and report as a single PDF document.

System Under Test (SUT)

The system under test for this assignment is the Oscar e-commerce platform that you also tested in the individual [Exploratory Testing](#) assignment. You can find the instructions for how to install and run Oscan in that assignment

Exploratory pair testing

Pair testing means that two people conduct testing together. In this assignment, you choose the focus of the testing. You can take inspiration from Session-based or Tour-based testing and also from a quality model like ISO/IEC 25010.

The pair consists of two roles (Driver and Observer/Navigator):

- **Driver:** Only this person touches the computer, i.e., uses the mouse and keyboard and makes the final decisions of what to do in the system (but should discuss with the Observer/Navigator and take their ideas and comments into account).
- **Observer/Navigator:** Observes the driver, makes suggestions, asks questions, and takes notes.

If you have a sub-group of three, two persons can split the Observer/Navigator role.

Start by shortly discussing the testing charter together and then decide on who takes what role first. Switch roles after some time (e.g., 20 minutes) to make sure everyone has a chance to try the roles.

When doing the testing, the Driver performs actions in the SUT while the Observer/Navigator takes notes but also critically thinks about different testing actions that would be important to take. A sequence can always be repeated with variations to try different things. It is beneficial to discuss a lot and think about what could be done differently

When taking notes, try to be concise but document the main actions taken, the rationale behind them, and also options that you may have considered. The notes do not have to form full sentences but they should be understandable. For example:

Using shopping cart actions. Trying normal flow first. Considering what could go wrong with amounts. Trying to submit negative item amount. Issue: possible to buy negative amount.

Deliverables

A testing plan and report with the following parts as a PDF file:

1. Testing plan with each pair's charter.
2. Test report from each pair/sub-group. Document who was part of each pair/sub-group, and briefly describe the testing environment (e.g., online or in-person, what kind of equipment was used, how was the software set up and run, other things that may have an impact on the testing).
3. The group's analysis of the test reports. What test results can the group as a whole report? List issues found. Also assess the test coverage achieved in terms of how much of the charter's goals were met. This can be qualitative assessment.
4. Evaluation of the testing procedure. How well did the pair testing work? What aspects worked well and what aspects did not work well?

Submission: File submission. Upload the group's document as a PDF.

Grading: The assignment is graded as follows.
Testing plan with charters: 0-1p – The testing plan should explain the group's idea for how the work is divided and should include a clear charter for each pair/sub-group.
Test report from each pair/sub-group: 0-1p – The test report should demonstrate what testing actions were taken and what aspects were considered when choosing different possible paths. The persons performing the testing and the test environment should be documented.
Analysis of test reports: 0-2p – The analysis should summarise the findings from the testing on the group level and should include a list of all issues found and an assessment of the coverage achieved in terms of the testing charters.
Evaluation of the testing procedure: 0-1p – The evaluation should give reasons for why the pair testing worked or did not work in the different pairs/sub-groups and give reasons for why this may have been the case.

Use of AI: You may use AI tools to get inspiration for your submission, but you must not directly use AI-generated text in the answer. This is a group assignment and collaboration among the members of your group is required. You may also discuss the assignment with members from other groups, but your group's submission must not include parts made by other groups.

Submission status

This assignment requires submission in groups. You are not a member of any group, so you cannot create a submission. Please contact your teacher to be added to a group.

Group	Not a member of any group
Attempt number	This is attempt 1.
Submission status	Nothing has been submitted for this assignment
Grading status	Released
Time remaining	Assignment is overdue by: 127 days 4 hours
